flask

* from flask import Flask → I want to use ~~Flsk~~ Flask.

app = Flask(--name--) : Make a web site for me. [app = flask object]

@app.route("/") . This is home page. [@=decorator, app = flask obj., .route("/") → যখন কেউ "/" path-এ আসবে তখন def home(), run হবে.]

def home():
    return 'Hello user! This is my first Flask app'

↓

Terminal

↓

flask run + Enter

↓

Running on http://127.0.0.1.5000

- http: → protocol (Browser-কে সঠিক কথা বলার জন্য)
- 127.0.0.1 → IP add
- 5000 → port no. (যেখানে flask app চলবে)

{127.0.0.1 = local host}

↓

@app.route("/about")
def about():
    return 'This is about page'

@app.route("/contact")
def contact():
    return 'This is a contact us page'

Get methode	Post methode
1) get something	Send Something
2) ask server to give you something.	Send something for process.
3) don't send any data	data required
4) Ex: Page visit	Ex: Login/Register

* Syntax in Flask — How to use GET and POST

@app.route("/submit", methods=["GET", "POST"])
def submit():
    if request.method == "POST":
        return "You sent data!"
    else:
        return "You are just viewing the form."

[এখানে request-কে import করতে হবে.]

* Final Summary Table

Core Object	What it Does	Easy Example
request	Read what the user sends	request.form["name"] from a ~~from~~ form
response	Send something back to the user	return Response(..., mimetype=...)
redirect	Move the user to a diff.. page	redirect("/thank-you")
url_for	Build a route dynamically from function name	url_for("home") → "/home"
session	Remember user info across pages	session["username"] = "Sagar"
